BUILD EMBERLINE

05 / GOOGLE AI STUDIO MASTER IMPLEMENTATION BRIEF

How to use this brief

Upload PDFs 01–04 plus both original sprite reference images into Google AI Studio Build mode. Paste the following instruction as your main request. This brief deliberately limits playable scope to Blaze while retaining the nine-hero data model.

MASTER BUILD REQUEST — EMBERLINE: THE CRIMSON FLAME

You are an experienced Phaser 4 / TypeScript game engineer, technical game designer, and narrative implementer. Build a genuinely playable browser-based 2D side-scrolling action-adventure called EMBERLINE: THE CRIMSON FLAME. Do not respond with a concept pitch or a static website. Create the game project and working preview.

Reference hierarchy

- PDF 01 is the canonical world and scope specification.
- PDF 02 is Blaze’s complete narrative reference. Adapt dialogue into short, skippable in-game scenes.
- PDF 03 is the gameplay and six-zone acceptance specification.
- PDF 04 and the source sprite images define visual character identity; they are NOT clean frame atlases.
- In case of conflict, keep Version 1 playable scope and the continuity lock in PDF 01.

Scope lock

Only Blaze is playable. Build a Forge Gate opening tutorial, six completable zones in order (Meadow, Hills, Woods, Caves, River, Summit), a boss encounter in each, an optional Turning Point rescue in River, Shadow finale, and the borrowed dawn ending. Display eight additional characters as visible but clearly unavailable future content. Do not implement unfinished placeholder zones or fake playable unlocks.

Stack and architecture

- Use Phaser 4 and TypeScript for the game runtime, React for the surrounding menus; proper mount and destroy lifecycle.
- Prefer Phaser Arcade Physics for collisions and platforming; separate scene logic from data and UI.

- Use stable scene identifiers, versioned level JSON, enemy state machines, an asset manifest, and a modular Blaze controller.
- Use client-side versioned saves in Version 1. No API keys, untrusted generated code, or unnecessary AI calls during play.
- Make the game render at a consistent low-resolution logical size (e.g. 480 × 270) with crisp nearest-neighbor pixel scaling.

Playable mechanics

Implement A/D move, Space jump, J Flame Slash, K Crescent Wave, Shift Ember Dash, L Crimson Cyclone, E interact, Esc pause. Include jump buffering, coyote time, hit/hurt/death, health hearts, sparks, combo, skill meter, overheats, hitboxes, enemy AI, accessible attack telegraphs, respawn and checkpoints. All controls must work in the actual preview.

Content build sequence

- First, make Forge Gate tutorial, Hush invasion and one completed Meadow level with the Great Mope boss. Verify it is playable before expanding.
- Then add Hills and Rolling Gloom chase; Woods and Thornmother restoration; Caves and Echo Maw timing; River and Undertow moving rafts; Summit and Shadow mirror boss.
- Integrate checkpoint dialogue and the four required emotional beats: Alden sacrifice, optional children rescue, Shadow acceptance, temporary reunion and sunset.
- Finish with title menu, New Game/Continue, pause/settings, chapter select after completion, score summary, save/resume and credits.

Asset requirements

Use supplied images as reference only. Extract and use frame sequences only if their geometry and transparency can be validated. Otherwise implement consistent properly aligned temporary character sprites with real animation states, and clearly label them provisional. Never render a decorative card as the playable character.

Definition of done

Required test	Pass condition
Playability	Blaze moves, jumps, attacks, takes damage and can die/retry
Progress	Six zones connect; every objective and exit works
Bosses	All six encounters have patterns, health/state resets and victory triggers
Story	Tutorial, sacrifice, beacon lines, climax and borrowed dawn trigger correctly
Optional path	Retreat rescue playable but not required to win
Saving	Progress survives page reload and resumes at checkpoint
Roster	Nine names are shown; only Blaze is selectable
Stability	No unhandled exceptions, soft-locks or missing asset crashes

Truthful progress reporting

Work incrementally. Maintain an immediately playable build throughout. At the end of each iteration, report only features that are genuinely implemented and tested, remaining gaps, and the next specific build step. If a full campaign is too large for one pass, complete and test a smaller working slice instead of fabricating a complete game.

Follow-up prompts after first build

A — Combat and responsiveness

> “Audit Blaze’s controller, attack hitboxes, dash cooldown, jump buffer, coyote time, damage feedback and restart behavior. Fix all issues and demonstrate a working playable test level.”

B — Expand zones

> “Using the six-zone gameplay PDF, add the next zone with its unique level mechanic, checkpoint, boss state machine, win trigger and save transition. Do not alter already functioning zones.”

C — Narrative integration

“Integrate Blaze’s story PDF through short skippable cutscenes and one-line beacon memories. Preserve the interactive tutorial, Alden sacrifice, optional Retreat rescue and the borrowed dawn continuity.”

D — Final QA

“Run a full playthrough test from New Game to the borrowed dawn. Check all six bosses, retry states, optional Turning Point, save reload, level exits, HUD and credits. List unresolved issues explicitly.”
